Statement of Work and Commercial Proposal (SOW) — PivetTrack

Provider: PIVET DIGITAL AUTOMATIONS LLC
Product: PivetTrack (Software as a Service — Inventory Management System / WMS)
Prepared for: _____ (the **"Client"**)
Proposal number: SOW-2026-____
Issue date: _____
Validity of this offer: 30 calendar days from the issue date
Document version: 1.9 (draft) — November 4, 2026: states who holds the infrastructure accounts (Section 2.2), makes the B2B Order Portal and the B2B API a separate quote (2.3 and 3, as the Terms of Service already said) and removes a statement without measured support (3). **Pending legal review.** No changes to pricing or timelines.

> **English translation.** This is a translation of the Spanish SOW v1.9, provided for convenience. It has not been reviewed by an attorney. If the two versions conflict, the Spanish text prevails, as Exhibits B and C already state for their own text.
>
> **Preliminary note on this document.** This document is a **contract template (draft)**, including the performance thresholds and pricing conditions in Exhibits B and C, available for review by the Client and its advisors. It does not bind the Parties until it is executed. PIVET DIGITAL AUTOMATIONS LLC reserves the right to modify this document before it is formally executed.
>
> This proposal describes the scope, deliverables and commercial terms of the PivetTrack implementation. Its acceptance, by signing Section 6, incorporates by reference the **PivetTrack Service Level Agreement (SLA) and Terms of Use**, which will govern the subscription relationship on an ongoing basis. Any information the Client shared during the commercial process that led to this proposal remains protected under the **Mutual Non-Disclosure Agreement (NDA)** entered into by the Parties.

7. Exhibit B — Processing of High-Volume Imports and Inventory Counts
8. Exhibit C — SaaS Base Concurrency Limits and Enterprise Plan

1. Executive Summary

Every warehouse operation faces the same question sooner or later: **can we trust what the system says?** An editable stock ledger, an average cost that "someone" adjusted by hand last month, a physical count that crossed paths with a shipment recorded halfway through the audit — each of those gaps is an accounting discrepancy waiting to happen, and a difficult conversation with your accountant or an outside auditor.

PivetTrack is the SaaS solution from PIVET DIGITAL AUTOMATIONS LLC designed specifically to close those gaps, not just to "keep inventory":

- **Strict lot traceability.** PivetTrack is designed for distributors that handle products with lots and expiration dates. Every unit comes in with its lot and expiration date, what expires first ships first (FEFO), and in a recall the system identifies within minutes which customers received that lot, how much and in which shipment. Returns and receiving shortages are recorded with their document, their reason and, where applicable, their credit memo. Receiving can be done in two steps: the office enters the supplier's invoice and the floor blindly declares what arrived; each difference opens a discrepancy verified by a second Administrator.
- **Accounting without double entry (optional).** With the QuickBooks Online integration (Section 2.4), each confirmed operation reaches the Client's QuickBooks company as the corresponding accounting document, with no need to key it in twice. The QuickBooks account remains the Client's, and the Client or its accountant administers it.
- **Accounting immutability by design.** The PivetTrack Kardex (stock ledger) is an audit ledger that, once written, **cannot be altered or deleted** — not even by a system administrator. Every correction is recorded as what it is: a new traceable movement, never a silent rewrite of the past.
- **Automatic costing, with no parallel spreadsheets.** The Weighted Average Cost (WAC) of each product is recalculated in real time with every Receipt and every Client Return, mathematically and deterministically — with no dependence on an Excel file that only one employee knows how to maintain.
- **Wall-to-Wall and Cycle Audits, with auto-reconciliation.** PivetTrack supports both **partial** Inventory Counts (sampling-based cycle audits) and **General (Wall-to-Wall)** Counts: in the latter, the auto-reconciliation engine automatically identifies every product with system stock that was not physically counted and natively adjusts it to zero, with the operations team not having to key in a single shortage by hand — eliminating the human error and administrative hours that a truly comprehensive audit demands.
- **Active protection during physical audits.** PivetTrack's "Golden Rule" automatically freezes a warehouse while it has an Inventory Count in progress, blocking any movement that could throw the count out of sync — a protection that no Excel file or generic spreadsheet system can offer.
- **Custom Branding included.** PivetTrack adapts its interface —including the navigation bar— and the official documentation the system issues —the PDF receipts for each operation— with the Client's logo and visual identity, so that every screen and every receipt circulating before an auditor, an outside accountant or a third party looks like the Client's own system, with the corporate finish a serious operation demands.

- **Data capture built for the warehouse floor.** The product search in each transactional module can scan a barcode with a phone camera or a webcam (in addition to manual typing and physical scan guns, which already work with no additional setup), and moving between fields with the `Enter` key —including on the numeric keypad— lets users enter complete lines without ever leaving the keyboard or touching the mouse. On phone screens, detail-line tables are rearranged as cards so a supervisor can operate the system from the warehouse floor.
- **Buy in one presentation, sell in another.** Each product has its base unit and its presentations (for example, a pallet of 60 cases and a case of 12 units): it is received by pallet or case and sold by case or unit, and stock, cost and the Kardex are always kept in the base unit, with no manual conversions or hidden rounding.
- **Scale proven in testing.** In the Provider's test environment, PivetTrack operates with a catalog of **more than 165,000 SKUs** (165,382 with stock), on which Inventory Counts of more than 164,000 lines were imported and confirmed, even with 20 simulated operators shipping at the same time (Exhibit B.4). The SaaS Base sets no contractual limit on the number of SKUs.
- **Enterprise-level architecture**, with a managed PostgreSQL database, automated daily backup and containerized deployment, backed by a contractual availability commitment of **99.9% per month**.

This proposal details the scope, deliverables and investment required to put **PivetTrack** into operation in your warehouse.

---

2. Initial Implementation (Setup Fee)

2.1. Price

Item	Price	Terms
Initial Implementation (Setup Fee)	**US$ 3,500**	One-time payment
QuickBooks Online integration setup (optional, Section 2.4)	**US$ 500**	One-time payment, only if the Client contracts it

2.2. Included Deliverables

The Initial Implementation includes the following deliverables:

- ✅ **Cloud infrastructure setup:** provisioning of an **isolated instance** of PivetTrack exclusively for the Client. Its infrastructure projects (application and database) are opened in accounts in the Provider's name, which it administers as part of the Service, and they are not transferred to the Client; when the contract ends, the Client receives its data under SLA Section 6.
- ✅ **Base Data Migration (master catalog):** initial loading of the Client's product catalog from **one (1) Excel file** provided by the Client —which may come from an export of its ERP or its previous system—, **with no limit on the number of SKUs**. The file must include, at a minimum, the columns: *Code*, *Name*, *Unit of Measure* and *Initial Unit Cost*. It includes the Provider's assistance in adapting the file's columns to the PivetTrack import template and verifying the load together with the Client. If the file exceeds the Software's maximum upload size, the Provider will split it into parts at no additional cost,

and those parts are not considered an additional data source. The accuracy of the file's content is the Client's responsibility (SLA, Section 5.1).

- ✅ **Training: two (2) virtual sessions of two (2) hours each**, for the Client's operations team.
- ✅ **Corporate Visual Identity Setup:** insertion of the Client's logo and brand into the system interface (navigation bar) and all PDF receipts issued by PivetTrack, for a 100% corporate finish from the first day of operation.
- ✅ **Advanced Reporting Module Setup:** enabling native Excel (**.xlsx**) export of the Current Stock and Kardex reports and the Inventory Count receipt, ready for immediate use by the Client's accounting or audit department.
- ✅ **Technical documentation:** delivery of the official PivetTrack User Manual.
- ✅ **QuickBooks Online integration setup** (optional, if the Client contracts it, Section 2.1):
  - (a) connecting the instance to the Client's QuickBooks Online company, authorized by the Client's Super Administrator;
  - (b) choosing, together with the Client or its accountant, the income account and the cost or expense account the integration will use;
  - (c) initial reconciliation of the customer, supplier and product names that already exist in QuickBooks, so as not to duplicate them;
  - (d) defining the cutoff date: only documents confirmed from the time of connection are sent;
  - (e) reviewing, together with the Client, the first documents sent.

2.3. Express Exclusions

The Initial Implementation **does not include**:

- ❌ Custom software development of any kind.
- ❌ The **B2B Order Portal** and the **B2B API**.
- ❌ Integrations with third-party systems other than QuickBooks Online (for example, QuickBooks Desktop, Xero or another ERP or accounting system).
- ❌ Accounting services: setting up the chart of accounts, reconciliations, taxes, closings or corrections of entries within QuickBooks.
- ❌ Sending to QuickBooks documents dated before the cutoff date.
- ❌ Loading a second file or additional data source, and cleansing, consolidating or transforming the content of the Client's data (for example, consolidating catalogs from several systems or correcting codes, units or costs).
- ❌ Dedicated infrastructure for the simultaneous and sustained execution of high-volume processes (Enterprise Plan) — see **Exhibit C**.

> The services excluded above **are quoted separately**, through an additional commercial proposal at the Client's request.

2.4. QuickBooks Online Integration: Roles and Responsibilities

Applies if the Client contracts the integration (Section 2.1).

(a) The account belongs to the Client. The QuickBooks Online company, its subscription with Intuit, its chart of accounts, its users and every accounting or tax decision belong to the Client and are administered by the Client or its accountant. The Provider has no user on that account and does not act as an accountant.

(b) PivetTrack is a one-way automated bridge. It creates in QuickBooks the documents corresponding to operations confirmed in PivetTrack:

- an Invoice for each Shipment whose lines all have a sale price;
- a Bill for each Supplier Receipt;
- a Credit Memo for each Client Return;
- a Vendor Credit for each Return to Supplier and for each receiving shortage closed with a credit memo.

It does not modify or delete existing records in QuickBooks. It only queries what it needs to operate: the company name, the available accounts, and whether a customer, supplier or product already exists under the same name.

(c) Client review. The Client reviews the documents the integration records. Accounting corrections are made in QuickBooks. Once a Shipment's invoice has been sent, its sale prices are locked in PivetTrack so that the two systems do not fall out of alignment. Credits remain as a balance in the Client's favor, and the Client applies them in QuickBooks.

(d) Availability. If QuickBooks or Intuit is unavailable, documents remain queued and are retried automatically. The status of each submission is shown on the "QuickBooks Submissions" screen. QuickBooks availability is not part of PivetTrack's availability commitment (SLA, Section 2).

(e) Disconnection. The Client may disconnect the integration at any time, from PivetTrack or from its Intuit account. What has already been sent remains in QuickBooks.

---

3. Monthly Subscription Plans (SaaS)

Once the Initial Implementation is complete, the Client accesses PivetTrack under a recurring monthly subscription model, with a single tier:

Plan	Monthly price	Includes
SaaS Base (called the "Standard Plan" in commercial materials)	**US$ 800 / month**	Unlimited users — transactional support guaranteed for up to **120 simultaneous users**, with a response time of up to 0.5 s in the picking flow, under the conditions of Exhibit C (the Provider's capacity study is available at the Client's request). No contractual limit on catalog SKUs or lines per Inventory Count (Exhibit B).

Plan	Monthly price	Includes
QuickBooks Online integration (optional, Section 2.4)	**US$ 200 / month**	Added to the SaaS Base subscription for as long as the integration is contracted. Covers the operation and maintenance of the automated bridge: sending and retrying documents, following up on submissions with errors, renewing the authorization with Intuit, and adapting PivetTrack to changes in the QuickBooks API.

The SaaS Base includes, at no additional cost or per-seat charge, PivetTrack's functional modules, except the B2B Order Portal and the B2B API (Section 2.3): (Receipts, Shipments, Returns, Write-offs, Transfers, Inventory Count, Kardex and Reports; presentations and units of measure, with purchase and sale by pallet, case or unit; lots and expiration dates with FEFO shipping, lot traceability for recalls and a near-expiry report; two-step receiving and receiving discrepancies with a double check), the background processing engine for high-volume imports and Inventory Counts (Exhibit B), the 99.9% monthly availability commitment and the technical support described in the SLA — there is no number of "authorized users" limiting the account, no add-on per additional user, and no charge based on catalog size.

The SaaS Base also includes **automated daily backup** of the Client's database, retained for seven (7) days, under the terms of SLA Section 2.5: in a recovery from backup, up to twenty-four (24) hours of movements may be lost, and the standard deployment does not include a standby replica or automatic database failover. Point-in-Time Recovery (PITR), which reduces that maximum loss to minutes, **is quoted separately**, through an additional commercial proposal at the Client's request.

> **When is something more than the SaaS Base needed?** The SaaS Base covers the warehouse transactional operation (picking, receiving, shipping) up to the guaranteed limit of 120 simultaneous users. Catalog size does not constrain it either. The factor that does constrain the SaaS Base is **concurrency**: the **routine and sustained** (not occasional) need to run several high-volume processes at the same time (for example, several warehouses closing inventory in the same time window) or for several users to generate heavy inventory reports at the same time — see **Exhibit C** for the technical detail and the criteria for when to discuss the Enterprise Plan (Advanced Infrastructure Add-on).

---

4. Commercial Terms

4.1. Payment of the Initial Implementation

The Setup Fee of **US$ 3,500** must be **invoiced and paid in full (100%) in advance** as a condition for starting the setup work described in Section 2. Implementation work will not begin until payment has actually been received. If the Client contracts the QuickBooks Online integration, its setup (**US$ 500**) is paid under the same terms: together with the Setup Fee if contracted with this proposal, or in advance before the connection if contracted later.

4.2. Monthly Subscription Billing

The monthly subscription is billed **in advance**, within the **first five (5) days of each calendar month**, according to the plan contracted by the Client and to the billing terms (SLA Section 8.2) and late-payment interest and collection terms (SLA Section 8.3).

If the Client contracts the QuickBooks Online integration, its monthly charge of **US$ 200** is billed together with the subscription, under the same terms, from the month in which the Client's QuickBooks company is connected. If the Client cancels the integration in writing, the charge stops being billed from the following month; disconnecting it on screen does not, by itself, amount to canceling it.

4.3. Taxes

The prices stated in this proposal are net. The tax treatment applicable to the subscription and the implementation services is governed by SLA Section 8.1.

4.4. Validity of the Offer

The prices and terms of this proposal are valid for **30 calendar days** from their issue date. If that period lapses without the Client having accepted it, PIVET DIGITAL AUTOMATIONS LLC may update the prices or terms offered here.

4.5. License of Use

Subject to compliance with this agreement and to full and timely payment of the applicable fees, PIVET DIGITAL AUTOMATIONS LLC grants the Client a limited, non-exclusive, non-transferable and revocable right to access and use the Software for its internal business purposes, exercised through its personnel and authorized users, and limited to the operating capacity of the contracted infrastructure under the Subscription Plan in Section 3 and to the performance limits described in Exhibits B and C of this Proposal. This license does not include any right to copy, distribute, reverse engineer or install on the Client's own infrastructure, nor any right to the source code, the architecture or any other intellectual property element of the Software, all of which remain at all times the exclusive property of the Provider as set forth in the Service Level Agreement (SLA, Section 1.2).

---

5. Estimated Timeline

The following timeline is for reference and starts running from receipt of the Setup Fee payment (Section 4.1):

Stage	Activity	Estimated duration
1	Setup of the isolated cloud instance	2 to 3 business days
2	Receipt and validation of the Client's Excel file; Base Data Migration	3 to 5 business days
3	Training Sessions (2 sessions of 2 hours)	1 week
4	Delivery of technical documentation and **go-live**	At the close of Stage 3

Stage	Activity	Estimated duration
5 (optional)	Connection to QuickBooks Online, choice of accounts with the accountant, cutoff date and review of the first documents (Section 2.4)	2 to 3 business days from go-live

Total estimated implementation time: 2 to 3 weeks, subject to timely delivery of the Client's Excel file in accordance with the requirements of Section 2.2 and to the availability of its operations team for the training sessions.

---

6. Acceptance of the Proposal

The Client's signature on this proposal constitutes acceptance of its scope, deliverables and commercial terms, and the incorporation by reference of the PivetTrack Service Level Agreement (SLA) as the contractual framework for the subscription.

For PIVET DIGITAL AUTOMATIONS LLC:

Name	_____
Title	_____
Signature	_____
Date	_____

For the Client:

Title	_____
Contracted plan	SaaS Base — US$ 800/month (Section 3)
QuickBooks Online integration	☐ Yes — US$ 500 setup, one-time payment, and US$ 200/month (Sections 2.1, 2.4 and 3) ☐ No
Signature	_____
Date	_____

> Exhibits B and C are presented in Spanish and English in the Spanish version of this document and form an integral part of this Commercial Proposal. In the event of a conflict of interpretation between the two versions, the Spanish text prevails. The figures in Section C.1 are backed by empirical, verifiable load runs documented in the Provider's capacity study, available at the Client's request.

Exhibit B — Processing of High-Volume Imports and Inventory Counts

B.1. Background Processing Included, With No Contractual SKU Limit. The SaaS Base includes PivetTrack's background processing engine. Excel imports (of products or counts) and Inventory Count confirmations that exceed the volume thresholds configured in the Software run outside the user's request, in batches, with progress shown on screen. **The SaaS Base sets no contractual limit on the number of SKUs in the Client's catalog or on the number of lines per Inventory Count document.** Each import file is subject to the Software's maximum upload size; a volume exceeding it is imported in several files.

B.2. Integrity and Resumption. Each batch is applied in its own transaction. If the process is interrupted (for example, by an application restart, an update or maintenance), it resumes automatically, without duplicating or omitting movements.

B.3. Warehouse Status During Confirmation. While an Inventory Count is being confirmed in batches, the warehouse remains frozen (SLA, Section 5.4) and the document accepts no changes. Batch confirmation is neither instantaneous nor atomic as a whole: until it finishes, the warehouse stock and the Weighted Average Cost of the affected products reflect the batches already applied. The Client accepts this mode as a condition of high-volume processing.

B.4. Reference Times, Not Guaranteed. For reference only: in a run on the Provider's staging environment on October 14, 2026, with no other users operating at the same time, an Inventory Count of 164,382 lines was imported from Excel in about 20 seconds, opened for review in under 1 second, and was confirmed in about 2 minutes. In another run on the same environment, on October 23, 2026, over a catalog of 165,382 SKUs with stock, a General Inventory Count of 167,383 lines (3,002 of them with lots) was confirmed in about 3 minutes (186 seconds) while 20 simulated operators recorded outbound orders in another warehouse, with a 95th-percentile response time of 328 ms during the confirmation. Actual times vary with volume, concurrent load and infrastructure factors outside the Provider's exclusive control, and the Provider **does not guarantee any specific duration** for background processes.

B.5. Shared Resources. SaaS Base background processes share the resources of the Client's instance with its users' operations: while a high-volume process runs, the rest of the Software may respond with higher latency. The routine, sustained execution of several high-volume processes at the same time is governed by **Exhibit C**.

B.6. Relationship to the SLA. As long as the Software remains accessible, the duration of a background process —including its resumption after an interruption— does not constitute unavailability for purposes of the 99.9% monthly availability commitment set forth in the Service Level Agreement (SLA, Section 2.3(g)).

Exhibit C — SaaS Base Concurrency Limits and Enterprise Plan

C.1. Guaranteed Performance of the SaaS Base. The standard PivetTrack deployment (Section 3 of this Proposal) guarantees, within the SaaS Base: (i) warehouse transactional support (picking, receiving, shipping, inventory counts) for up to **one hundred twenty (120) simultaneous users**, except as provided in Section B.5 of Exhibit B; (ii) for that same limit, a **response time of up to 0.5 seconds** in the picking

flow, under the terms of Section C.1.1; and (iii) up to **two (2) concurrent heavy inventory report exports** (unpaginated Stock/Kardex Excel files), without noticeable degradation to the rest of the system.

C.1.1. Scope and Conditions of the Response Time. The guarantee in Section C.1(ii) is governed by the following and does not apply outside these conditions:

(a) *Simultaneous users.* People with an open session operating at the same time, with the normal pauses of their work; it does not mean requests at the same instant. Together, users and integrations must not exceed **fifty (50) requests per second**.

(b) *Measurement.* The measure is the **95th percentile** of the duration of the requests in the Shipment picking flow (searching the SKU, checking availability, saving and confirming), at the application server, over a continuous window of **fifteen (15) minutes**, using the Provider's records. It excludes the Client's network, the Internet and browser rendering time. Up to five percent (5%) of requests may exceed that time without a breach.

(c) *Load.* During the window there must be no heavy report exports or high-volume processes (Exhibit B) in progress, and none of the events in SLA Sections 2.3(a) to (f) and (i), and picking must be spread across at least **twenty (20) distinct SKUs**.

(d) *Data volume.* The instance must not exceed **three hundred thousand (300,000) Shipments** or **two million (2,000,000) stock-ledger movements** in its history.

(e) *Remedy.* If the Client reports it and the Provider confirms the breach using that measurement, the Provider will handle it as a High Severity (Sev. 2) incident under SLA Section 4.2 until corrected. That is the Client's **sole and exclusive remedy** for this matter: it does not give rise to service credits, does not count as unavailability, and is subject to SLA Section 5.5.

C.2. Expected Degradation Above the Guaranteed Limit. Above one hundred twenty (120) simultaneous users, or outside the conditions of Section C.1.1, there is no guaranteed response time. From three (3) concurrent heavy report exports onward, or while three (3) or more high-volume processes (Exhibit B) run at the same time, the Client may experience latency degradation across the rest of the system (including other users' transactional use) while those tasks are processed — the Software will continue to respond, without service outages, but without a guaranteed response time in that range.

C.3. Enterprise Plan (Advanced Infrastructure Add-on). Catalog size alone does not require the Enterprise Plan. The following needs, when **routine and sustained** (not occasional), are **out of scope** for the SaaS Base under this Proposal and fall under the Enterprise Plan: (i) three (3) or more concurrent heavy report exports; (ii) three (3) or more concurrent high-volume processes (Exhibit B), for example three or more warehouses closing inventory in the same time window; and/or (iii) guaranteed response times for transactional operations while high-volume processes run. The Enterprise Plan adds to the Client's instance dedicated job queues and processing servers, separate from those serving users, plus priority support; it **is not included in the standard scope of this Commercial Proposal** and is quoted separately, following an audit of the Client's actual concurrency, through an additional commercial proposal, per the same mechanism established in Section 2.3 of this Proposal for excluded services.

C.4. Relationship to the SLA. Any latency degradation resulting from operating above the limits defined in C.1, or in the cases described in C.2 and C.3, is excluded from the 99.9% monthly availability commitment set forth in the Service Level Agreement (SLA, Section 2.3(h)).

Commercial proposal prepared by PIVET DIGITAL AUTOMATIONS LLC. Prices are stated in United States dollars (US$). This proposal does not, by itself, constitute the PivetTrack Service Level Agreement (SLA) or Mutual Non-Disclosure Agreement (NDA), but incorporates them by reference as stated on this page.
